□

Professional Profile

I have 1.7 years of experience on developing high scale enterprise applications using React.js, Node.js, Mongo DB, HTML, CSS, Java Script, Tailwind CSS, Visual Studio Code, Postman, GitHub and Netlify etc.

I have been worked into the applications mostly on all phases of development like: Requirement gathering, design analysis, development, testing and deployment of the applications in the Agile methodology.

I am highly motivated and passionate and I have expertise on Mern stack development and Java script development with a strong fundamental in object-oriented programming and a desire to apply my skills and knowledge to contribute to the success of a dynamic software development team. Seeking the position where I can further enhance my development expertise, collaborate with experienced professionals, and actively contribute to the design and development of innovative software solutions.

- Experience on node.js

□

Employment History

1. Working as Junior Software Developer in Manasvi Technologies OPC Pvt. Ltd., Bhopal from JUNE 2023 to till date.

JUNE 2023 – present

Junior Software Developer

□

Technical Skills

Experience.

- Technologies : React JS, HTML, CSS, JavaScript, tailwind CSS, Node.js, Mongo DB,
- Tools : GitHub, Postman
- Operating System : Windows

☐ IDE's : Visual Studio Code.

Awareness:

☐ MySQL, Java, C++, C

Project #1

Project: HRM (Human Resource Management) CRM (Customer Relationship Management)

Role: Frontend Developer

Description:

HRM and CRM are both important systems used by businesses, but they serve different functions:

HRM (Human Resource Management): HRM is a set of practices aimed at effectively managing the workforce of an organization. It involves activities such as recruitment, hiring, training, performance management, and employee relations. HRM systems help automate and streamline these processes, making it easier for HR professionals to manage employee data, track performance, administer benefits, and ensure compliance with labor laws and regulations.

CRM (Customer Relationship Management): CRM, on the other hand, focuses on managing interactions and relationships with customers. It involves strategies, practices, and technologies that companies use to analyze customer data, track customer interactions across various channels (such as email, phone, social media, and in-person), and improve customer satisfaction and loyalty. CRM systems help businesses organize customer information, track sales opportunities, manage marketing campaigns, and provide better customer service.

While HRM systems primarily deal with internal processes related to employees, CRM systems focus on external interactions with customers. Both systems are crucial for businesses to efficiently manage their workforce and maintain strong relationships with customers. Integrating HRM and CRM systems can provide additional benefits by allowing organizations to have a more holistic view of their employees and customers, leading to better decision-making and overall performance.

Responsibilities:

- Involved in requirements analysis, designing, coding of the application.
- Front end UI totally developed by using React JS and every UI pages are as a component and to retrieve and display the data on UI, called rest Api using axios Api in react which was developed by me and my team and setting data as State and Props as per requirement.
